**LOK JAGRUTI KENDRA UNIVERSITY,
AHMEDABAD**

COMPUTER ENGINEERING

CERTIFICATE

This is to certify to **Tirth Patel and Margish Dholariya** of B.E Semester **5th C.S.D. and C.S.E.** Class, has satisfactorily completed his Mini Project work of the subject **Project Report on SHOPEASE WEBSITE** during the academic year **2023-24** submitted on _____.

Head of Department

Prof. Shruti Raval

Computer Department

LJIET, Ahmedabad

This is to certify that this term work is accepted and assessed on _____

Examiner

Convener

ACKNOWLEDGEMENT

I heartily thankful to all faculty members of the department of Computer Engineering from L.J University, Ahmedabad for making my project. It is my pleasure to take this opportunity to thank all people who helped me directly or indirectly to prefer this project would have been impossible without their guidance. They all encouraged and trusted in our ideas. They were always available for us to give guidance about the project. The disruption about the project and the great advice given by them helped to make this project complete. We are thankful to them pristine and enlightening guidance given to as throughout the semester.

ABSTRACT

We will create an Shopease Shopping on internet and connect over all world. People in one unit to buy different varieties and multi brand product.

The goal of Shopease Shopping website is to provide consumer with their required products on their door steps.

The website allows the customer to purchase from Shopease Shopping saves their time. The Shopease Shopping provides some great deals and discount offers so consumer can take advantage of it and save money also.

The user is able to purchase for many types of clothing products using this application various brands and company increasing sales & marketing to their products via Shopease Shopping website.

7.5 Activity Diagram for User

Ch-8 Conclusion and Discussion Reference

8.1 Conclusion

Chapter: 1

Introduction

- Introduction to Current System
 - Introduction to Your Project
 - Introduction To My System
-

1.1 Introduction to current system:

- Online shopping or e-shopping is a form of electronic commerce which allows consumers to directly buy goods or services from a seller over the internet using a web browser.
- Alternative names are: e-web-store, e-shop, e-store, Internet shop, web-shop, webstore, online store, online storefront and virtual store.
- Mobile commerce (or m-commerce) describes purchasing from an online retailer's mobile optimized online site or app.
- An online shop evokes the physical analogy of buying products or services at a bricks-and-mortar retailer or shopping centre the process is called business-toconsumer (B2C) online shopping.
- In the case where a business buys from another business, the process is called business-to-business (B2B) online shopping.
- The largest of these online retailing corporations are Alibaba, Amazon.com, and eBay.
- Retail success is no longer all about physical stores.
- This is evident because of the increase in retailers now offering online store interfaces for consumers.
- With the growth of online shopping, comes a wealth of new market footprint coverage opportunities for stores that can appropriately cater to offshore market demands and service requirements.

1.2 Introduction To your project:

- We will create an e-mail on internet and connect over all world's people in one unit to buy different varieties and multi brand product.
- The goal of E-mail website is to provide consumer with their required products on their door steps.
- The website allows the customer to purchase from E-mail which saves their time. The E-mail provides some great deals and discount offers so consumer can take advantage of it and save money also.
- The user is able to purchase for many products like clothes , accessories , electronic item, jewels , furniture ,interior decoration for house etc.
- Using the application various brands and company increasing sales & marketing to their products via E-mall website

1.3 Introduction To My System:

- Saves money by not needing to use gas to find what you are looking for.
- You will not make a trip to mail . No sales tax.
- This option work as long as the online retailer is in a different state.
- There will not be a long wait in the checkout lanes.
- Compare prices from many retailers easily by using services such as Google product search.
- The receipt for your purchase is automatically e-mailed to you which provides convenience and saves paper.
- Internet shoppers saves time.
- The internet is open 24*7/365.
- Our system guarantees you that the personal data feed by the consumer in the system at the time registration will not be leaked • It is an reliable system.

Chapter: 2

Objectives

- Goals & Purpose
-

2.1 Goals & Purpose:

- The goal of online shopping arcade website it to provide consumer with their required products on their door steps.
- The website allows the consumer to shop online which save their time
- The online store provides some great deals and discount offer so consumer can take advantage of it and save money also
- The user is able to shop for many products like clothes, accessories , electronic items etc. In just one click.
- From business point of view we help various brands to sell their products online , this helps in increasing sales of the company as they get customers from worldwide.

Chapter: 3

Problem Definition & Benefits

- About existing system
 - Drawback and Problem without existing system
 - User Benefits
-

3.1 About existing system

- System analysis is the detail study of the various operation performed by the system and their relationship within and outside the system.
- Analysis is the process of breaking something into its parts so that the whole may be understood.
- System analysis is concerned with becoming aware of problem , identifying the relevant and most decisional variable , analysing and synthesizing the version factors and determining into an optional or at least a satisfactory solution
- During problem is identified, alternate system solution are studied and recommendation are made about committing the resources used to the system.
- You usually have to wait long periods of time to receive your products.
- Sometimes, this can even take up to a month or longer if being shipped from overseas.
- There could be delays on the delivery, or miscommunication and you can't go to the store or get in contact with someone face to face.
- Usually, there is no one to ease your frustration about any delays that occur.
- Shipping costs on your item can be extremely high in comparison to what you paid for the products, sometimes making the purchase not worth it.
- Sometimes looks can be deceiving. You don't get to test the products before you buy it.

3.2 Problem And Weakness Of Current System:

- We will create an Online Shopping Arcade on internet and connect over all world's people in one unit to buy different varieties and multi brand clothing product.
- The goal of Online Shopping Arcade website is to provide consumer with their required products on their door steps.
- The website allows the customer to purchase from Shopping Arcade which saves their time. The Shopping Arcade provides some great deals and discount offers so consumer can take advantage of it and save money also.
- Using the application various brands and company increasing sales & marketing to their products via Shopping Arcade

3.3 User benefits:

- To help user buy product easily saving time and money required to spend by visiting bricks and mortar stores.
 - Saving time and money:
- Instead of driving around wasting gas or spending hours on the bus in travel time you can visit all the stores that you are interested in at once. This eliminates time going from store to store to see what is available and at what price.
 - Discount and special offers :
- In online shopping arcade buyer get easily discount on product, there is special discounts in festivals or any some special days like (friendship day, valentine day etc.).
 - 100% Buyer Protection:
- People have not to worry about fraud or theft with credit cards purchases.
- We make sure that in our websites you shop from is security verified secure verified secure and protected and has this information displayed clearly on their website.
- Also the privacy policy on the privacy on the websites to see what they will do with your information is displayed. ○ Deliver and shipping facility:

Chapter: 4

System Analysis And Design

- **System development Lifecycle**
 - **Identifies activities of system (Primary)**
 - **Feasibility Study**
-

4.1 System Development Life Cycle:

- The systems development life cycle (SDLC), also referred to as the application development life-cycle, is a term used in systems engineering, information systems and software engineering to describe a process for planning, creating, testing, and deploying an information system.
 - The systems development life-cycle concept applies to a range of hardware and software configurations, as a system can be composed of hardware only, software only, or a combination of both.
- Requirement analysis : This phase is used to gather the requirement for the system
 - Design : This phase is used to build up the design for the System
 - Construction : This phase is used to develop the system
 - Testing : This phase is used to test the system with various methods
 - Acceptance : This phase is used in deployment and acceptance of the system

4.2 Identifies activities of system (Primary)

- The activity we followed for this project is listed below:
- Planning the work or the objectives.
- Analysis and design of objectives.
- Accessing and controlling risk (or risk management)
- Estimating resources.
- Allocation of resources.
- Organizing the work.

- Database designing.
- Precision is a useful metric when the cost of False Positives is high (e.g., in medical diagnosis), as it measures how many of the predicted positive instances are actually relevant.

4.3 Feasibility Study

- One of the important activities of any project is to check whether a project is worth proceeding or not.
 - Simply stated this test of feasibility asks that if the system will work when developed and installed.
 - Hence a feasibility study gives us more idea about the actual behavior and environment of the website.
 - So the following aspects determine the scope of the website briefly classified into three feasibilities.
- Operational Feasibility
 - Technical Feasibility
 - Economic Feasibility

○ Operational Feasibility

- The Online Shopping Arcade is designed in such a way that users find it really very easy to navigate the website.
- The flow of the pages and links are arranged that user find it really very easy to browse through products, place orders, make payment easily.
- The website is totally operational where users can move from any page to all of the pages of the websites.

- Navigation of the Website:

- Home Page
- Registration Page
- Order Placing Page
- Billing Page

- ***Home Page:***

- First is the home page from where users will be able to navigate to all pages.
- Mainly the users will be required to login, signup and move to product page.
- After Login the user will be redirected to the home page.
- From Registration page the user will be redirected to the login whereby the user can login and buy products.

- ***Registration Page:***

- The user will be able to make its account by signing up for the website which will be done through this page.
- Hereafter the user will be able to buy the products.
- Products Page:

- Next is the products page where the users will be able to navigate to all pages.
- Mainly the users will be required to order placing and billing page.

18

- ***Order Placing Page:***

- After viewing the products the user will require the order placing page. The user will be able to place order via this page.

- ***Billing page:***

- After placing the order the user will require his/her bill which he can view from this page.
- Hence the conclusion of operational feasibility is that the website is totally operationally feasible.

○ **Technical Feasibility**

- A system has a technical feasibility is the organization has the resources to develop or purchase, install and operate the website.
- The Online Shopping Arcade is prepared in such a way that it runs smoothly within the technology available in the market.
- The backend used is SQL Lite 3 and the frontend is JS, HTML, CSS which are frequently used in the website development market.
- The website will be viewed in most of the available web browser.
- The website does not need any technical expertise.
- The purposed platform has in a enough capacity for future needs and if needed can be expanded.
- The interface will be easily operable by the users.

○ Economic Feasibility

- The system has economic feasibility the projected benefits of the development of the website out weight the estimated cost.
- The cost of hardware and software is negligible.
- Hence the economic feasibility also proves that the website is economical feasible.
- The financial and economic questions raised by analyst during the preliminary investigation for purpose of estimating the following.
- Cost to conduct a full system investigation.
- Cost of hardware and software for the class of application being considered.
- The benefits in the forms reduced cost or fewer costly errors.
- The cost is nothing changes(i.e. the proposed project is not developed)

Chapter: 5

Project Management

- Project Planning & Scheduling
 - Risk Management
-

PROJECT MANAGEMENT

Chapter: 5

5.1 PROJECT PLANNING & SCHEDULING:

○ Project Planning:

- Project planning is the process of quantifying the amount of time and size of the budget for project.
- The output of the project planning process is project plan which can be used to track the project progress.
- Approach that will be followed for this project is waterfall model.
- It contains of different phases named planning, System Analysis, System Design, System Implementation, System Operation & Support.

○ Project Scheduling:

- There are many activities to be carried out during website development.
- After doing all the analysis & planning it is very important to prepare a schedule implement planning done.
- We can set milestone by preparing schedule and this helps us in achieving our goal.
- By scheduling we set a time period for each activity so may not run out of time in development the whole website.
- According to the period of 6 months the OSM"s development is carried out in 3 quarters.
- The scheduling is shown by the Gantt and the pert chart.

○ Project Development Approach And Justification:

‡ *The activities we followed for this project is listed below:*

- Planning the work or objectives
- Analysis & Design of objectives
- Assessing and controlling risk (or Risk Management)
- Estimating resources
- Allocation of resources
- Organizing the work
- Database Designing
- Form Design

5.2 Risk Management:

- Risk management is the process of measuring, or assessing, risk and developing strategies to manage it.
- Strategies include transferring the risk to another party, avoiding the risk, reducing the negative effect of the risk, and accepting some or all of the consequences of a particular risk.
- Traditional risk management focuses on risks stemming from physical or legal causes. Financial risk management, on the other hand, focuses on risks that can be managed using traded financial instruments.

○ Steps in the risk management process :

Establishing the context involves:

- Planning the remainder of the process.
- Defining a framework for the project process and an agenda of identification

23

- Developing and analysis of risk involve in the process.
- Mapping out the following: the scope of the exercise, the identity and objectives of stakeholders, and the basis upon which risks will be evaluated.

Risk Analysis

- Once risk have been identified, they must then be assessed as to their potential severity of loss and probability of occurrence. Regardless of the prevention techniques employed, possible threat and that could arise inside or outside the organization need to be assessed.
- If by mistake any person threat Administrator password then he can change the data in software and can leak information.
- Same thing occurs if the wrong user is authorized. The software may be in problem by natural threat.
- The relative probability of a disaster occurring should be determined. Here by the first risk can occur because of the less of communication with all branches of Apollo for requirement fulfillment .for example, the company may not have interacted with the branch of Apollo in U.S.A. and that branch needs some additional functionality of the software.

○ Disaster Prevention

- Disaster prevention and preparedness begins at the top of an organization. The attitude of senior management toward security and prevention should permeate the entire organization. Therefore manage support of disaster planning can focus attention on good security and prevention techniques and

better prepare the organization for the unwelcome and unwanted. Disaster prevention technique include two categories.

24

○ Procedural prevention:-

- Procedural prevention relates to activities performed on a day-to-day, month-to-month, or annual basis, relating to security recovery.
- Procedural prevention beings with assigning responsibility for overall security of the organization to an individual with adequate competence and authority to meet the challenges.

○ Physical prevention:-

- It includes special requirements for building construction, as well as fire protection for various equipment component

○ Risk planning:- •

Retention

- Mitigation
- Elimination
- Buying insurance

○ The planning by which the risk cannot occurred if it is :

- Interact with all branches.
- Authorized carefully and creating new safe security system for that.
- Make new security for natural threat

Chapter: 6

System Requirement

- User Characteristics
 - Constraints
-

6.1 User Characteristics:

The user should be familiar with the E-Mall related terminology like Shopping cart/Checking out/Transaction etc.

The user should be familiar with Internet.

The Online Shopping Arcade divided into 2 modules

- Administrator module
- User module

○ Administrator Module :

The overall management of website is carried out through this module. All new categories of products, all special offers of products will be done through this module.

○ User Module:

The user Module consists of user. Users are divided into two types

User/Customer

Visitors

Customers are the users already registered with the website. The user will get all the services of the websites i.e. they can buy products from the website directly. Visitors are the users who can just view products. To buy products first the visitors has to get registered with the website.

Shopping is carried out in this module. User willing to buy the products adds the products to the virtual shopping cart. The shopping cart is processed and the final shopping amount is provided to user for payment. The user makes payment and products are delivered to their place.

6.2 Constraints:

Constraint is a property assigned to column or the set of columns in a table that prevents certain types of inconsistent data values from being placed in columns(s).

Constraints are used to enforce the data integrity. This ensures the accuracy and reliability of the data in the database.

The following categories of the data integrity exist:

1. Entity integrity
 2. Domain integrity
 3. Referential integrity
 4. User-Defined integrity
- Entity integrity ensures that there are no duplicate rows in a table.
 - Domain integrity enforces valid entries for a given column by restricting the type, the format, or the range of possible values.
 - Referential integrity ensures that rows cannot be deleted, which are used by other records (for example, corresponding data values between tables will be vital).
 - User-Defined integrity enforces some specific business rules that do not fall into entity, domain, or referential integrity categories

Each of these categories of the data integrity can be enforced by the appropriate constraints.

SQL supports the following constraints:

- Primary Key
- Foreign Key
- Check
- Not Null

- A Primary Key constraint is unique identifier for row within a database table. Every table should have primary key constraints to uniquely identify each row and only one primary key constraint can be created for each table. The primary key constraints are used to enforce entity integrity.
- A Foreign Key constraint prevents any actions that would destroy link between tables with the corresponding data values. A Foreign Key in on table points to a primary key in another table. Foreign keys prevent action that would leave rows with foreign key values when there are no primary keys that value. The foreign key constraints are used to enforce referential integrity.
- A Check constraint is used to limit the values that can be placed in a column. The check constraints are used to enforce domain integrity.
- A Not Null constraint enforces that the column will not accept null values. The not null constraints used to enforce domain integrity, as the check constraint.

Conclusion

- Conclusion
-

Conclusion:

- In conclusion, having access to online shopping has truly revolutionized and influenced our society as a whole. This use of technology has opened new doors and opportunities that enable for a more convenient lifestyle today.
- Variety, quick service and reduced prices were three significant ways in which online shopping influenced people from all over the world. However, this concept of online shopping led to the possibilities of fraud and privacy conflicts.
- Unfortunately, it has shown that it is possible for criminals to manipulate the system and access personal information. Luckily, today with the latest features of technology, measures are being taken in order to stop hackers and criminals from inappropriately accessing private databases.
- Through privacy and security policies, website designers are doing their best to put an end to this unethical practice. By doing so, society will continue to depend upon online shopping, which will allow it to remain a tremendous success in the future.
- Through the weeks of the design process the team worked cohesively to meet and go beyond the design specifications of the folding shopping cart project. The team researched multiple folding shopping carts online, as well as visiting local shopping centers. Customers were interviewed in order to get a sense of their needs.
- Over the course of the project the team was forced to adjust to the problems that arose. In the end, the team was successful in accomplishing the goals set forth at the beginning of the project and in constructing a prototype.
